BlackBerry Spy Software Hits the Market

LITCHFIELD PARK, Ariz., /PRNewswire/ -- Retina-X Studios, LLC, announce the immediate availability of Mobile Spy for RIM BlackBerry devices. Using this groundbreaking BlackBerry technology, users can silently monitor GPS locations, incoming and outgoing text messages (SMS) and call information of children or employees - even if activity logs are erased.

Mobile Spy had already been available for the iPhone, Windows Mobile and Symbian OS smartphones. The new version for the BlackBerry is now on the market.

Mobile Spy runs in total stealth mode and no mentions of the program are shown inside the BlackBerry. After the software is set up on the phone, it silently records GPS locations every fifteen minutes. The entire text of all SMS text messages along with the associated phone number is also recorded. Additionally, inbound and outbound call information with duration of the call is recorded.

Immediately after activities are logged, they are silently uploaded to the user's private online account. Accounts can be checked online from any web browser without needing further access to the phone.

Retina-X Studios CEO James Johns states, "With Mobile Spy, dedicated GPS tracking devices become obsolete. The BlackBerry can become the GPS tracking device and capture text messages and call information at the same time. This gives parents and employers a very effective way to monitor the locations and activities of children or employees."

This exclusive system helps businesses enforce their Acceptable Use Policy on company-provided phones. The software can also monitor teen or family phones. It gives a parent the ability to remotely monitor their child's texting activities by logging into a website from any web browser.

Another common use is to back up a user's own cell activity as a record of all important text conversations and travel details.

Mobile Spy runs on all modern BlackBerry devices and is also compatible with the iPhone and other smartphones running the Windows Mobile or Symbian OS operating system. These devices are available from most major mobile carriers. The BlackBerry version of Mobile Spy can be found at http://www.mobile-spy.com/spy-blackberry.html.
