Azimuth Systems Receives Von Magazine Innovators Award

Azimuth Systems has received a 2008 VON Magazine Innovator Award, which is the foremost listing of innovative companies that represent the future of the VoIP Communications industry. Azimuth has been named to the list as a result of their focus on streamlining the testing of fixed-mobile convergence (FMC) products for service providers, handset manufacturers and semiconductor vendors looking to prove that their solutions deliver the carrier-grade Wi-Fi quality-of-service required to drive rapid adoption of converged voice and data services.

Successful delivery of converged services is based on an assumption that wireless IP networks and devices can deliver carrier-grade QoS to the customer, requiring extensive performance benchmarking of mobile handsets and infrastructure devices in real world conditions. The Azimuth FMC Performance Test Suite is the industry's first fixed-mobile convergence performance test solution, which includes a comprehensive suite of automated test scripts that streamline the testing of fixed-mobile convergence products and validate the seamless mobility of devices and networks.

"We're pleased to recognize Azimuth as one of the Communications industry's best and brightest by honoring the company with the VON Magazine Innovator Award," said Bill Sell, publisher, VON Media Group. "The company's unique approach to testing emerging wireless technologies makes it a logical selection as a leader in the testing of FMC products. Their approach sets Azimuth apart from the large field of companies that participated in the nomination process."
