Instrument-Grade Precision Components and Calibration Standards

Maury Microwave announces the introduction of an entirely new line of instrument-grade precision components designed to provide users with the right level of performance at the right price. This new product line, TactiCal™ by Maury, includes calibration standards manufactured to the same high quality and exacting requirements that have made Maury's metrology-grade products the Gold Standard of the Test & Measurement industry for over 50 years.

TactiCal™ precision components and calibration standards include 50 ohm coaxial VNA calibration kits, opens, fixed loads, and shorts in 1.85 mm, 2.4 mm, 3.5 mm and type N. TactiCal™ between-series and in-series coaxial adapters are also included in the product line, and waveguide-to-coax adapters in these same connector types will also be available. Maury's road map for the TactiCal™ Solutions Line includes a Q3-2010 introduction of the 2.92mm family of Precision Components.

TactiCal™ calibration standards are ideal for applications that demand accuracy and repeatability, but don't require high cost metrology-grade/lab-grade performance. This means the TactiCal™ line can be offered at a significant cost savings to the user while providing the ruggedness and durability needed for high-volume field service and repetitive measurement applications.

Competitive prices, combined with high availability and short delivery times, make Maury TactiCal™ Solutions very attractive to users and industry managers alike.
