

E-Ink on a Smartphone? This Android Phone Has 2 Displays

Emily Price

What if your phone had two displays? Announced in mid-December, YotaPhone aims to change how people use their smartphones by bringing together a full-color LCD display on one side of the phone and an e-ink display on the other.

I caught up with Yota Device's Vladislav Martynov at [CES](#) to give the phone a closer look.

In essence, the two displays on the handset each have their own unique purpose. The front display is used just as you might your traditional smartphone screen to run apps, browse the web or watch videos.
