

Delay Line Filters

Delay Line Filters are an integral part of RF Power Amplifier feed forward chains. Trans Tech offers Delay Line filters in the 3 to 20 nanosecond range for the low power (less than 3 W) path. Phase linearity of 2 degrees and amplitude variation as low as 0.2 dB is achieved with a new SMT (surface mount) package. Available on tape and reel, these Delay Line Filters are for MCPA, and single-channel, base station power amplifier applications
