

Network Management Products

Network operators planning a smooth transition into 2.5G and 3G services — including those dependent upon GPRS — are actively seeking solutions that serve both business and technical requirements for ensuring optimal performance of the converged network. Recognizing that sub-optimal network performance drives customer churn, operators are actively seeking solutions that quickly and easily detect configuration problems and secure QoS from the wireless customer's point of view.

Part of our preview spotlights NetTest's masterQUEST, the first complete intelligence resource for automating the management of converged networks such as those delivering the wireless Internet. NetTest's masterQUEST performs monitoring of telecom and datacom signaling to enable the complete and efficient monitoring, verification and optimization of GPRS network performance.
