

Low Power Transceiver Module

Cirronet announced the availability of its high speed, low power WIT2411 transceiver module to provide OEMs with highly flexible wireless interconnectivity for a variety of devices and applications. Featuring an over-the-air data rate of 1.23 Mbps, the WIT2411 is appropriate when a cabled connection is not viable-due to obstructions, distance or cost.

The WIT2411 embeds easily into new and existing designs and features a small form factor less than 11 mm thick, a straightforward RS-232 style serial interface, CMOS-level signals and software-selectable I/O data rates. The module consumes minimal power and operates at 3.3 volts.
