

R&D Testing Solutions

These new products include a cdma2000 protocol application that runs on Agilent's E6900A wireless protocol test set. Software developers designing embedded applications can use the solution to connect devices to the Internet, analyze active or test data, and verify protocol transmission across the air interface. Agilent also introduced new lab applications covering cdma2000, W-CDMA, GSM/GPRS and EGPRS that offer more extensive test capability. Running on the 8960 Series 10 Wireless Communications Test Set, the lab applications provide all the features of the protocol applications plus comprehensive RF measurements. All of the new protocol and lab applications feature data channels for connecting to the Internet.
