

Wireless Networks and the Evolving Telecommunications Infrastructure

This comprehensive three-day UC Berkeley Extension course is focused on the principles, technologies, system architectures, standards, and market forces driving wireless access networks intended for multimedia services — telephony, data communications, portable computing, Internet access, and digital video.

The course is intended for systems engineers, hardware and software designers, R&D managers, and market planners who seek an understanding of current approaches and evolving directions for wireless access networks. It is also intended for engineers who are currently active or anticipate future involvement in these fields.
