

## Arrays

AVX introduces their TransFeed array in the 0612 (3.2  $\times$  1.6mm) package. Designated the V3F4 series, the device pairs the electrical characteristics of AVX's TransGuard (MLV) and FeedThru filters to offer circuit protection and EMI reduction over a broad range of frequencies. The TransFeed product has faster "turn-on" time and enhanced attenuation characteristics over the standard multilayer device. The single 0612 chip can be utilized in various end-user products including computers, bar code scanners, medical instrumentation, cellular phones and pagers. Typical applications include filtering/protection on microcontroller I/O lines, interface I/O lines, power line conditioning, and power regulation.
