

RMG Dual-band Antenna

Antenna Factor announces its RMG dual-band antenna base that combines a high performance internal GPS antenna with an RP-SMA connector. A range of connectorized antennas can be attached to the connector, enabling the coverage of all popular frequencies. The GPS antenna and connector are housed in a durable base that is intended for permanent through-hole mounting. Each antenna can be terminated in a variety of standard or custom connector types. The cables feed through a threaded metal post with a flexible compression gasket that resists the intrusion of water or dirt, and it protects the attachment surface. The antenna is suitable for vehicular applications, although its range of applications is virtually unlimited
