

Signal Generator Covers RF and Microwave Frequencies

Anritsu Company introduces its MG37020A fast-switching microwave signal generator that covers both RF and microwave frequencies from 10 MHz to 20 GHz. The device, with 100 μsec per point typical switching speed, is a suitable signal source for RF and microwave applications requiring frequency agility, including data intensive applications such as antenna testing and satellite payload testing. It is also appropriate for integration into automated test systems, such as those used for RFIC and MMIC manufacturing where minimum test time and maximum throughput is critical.
