

# Handheld Analyzers Offer Software Enhancements

Anritsu Company's Site Master and Cell Master handheld analyzers now include firmware for sweep speed, optical Distance-to-Fault (DTF) measurement capability, post analysis tools and a phase-stable cable with reinforced handgrip. The firmware speeds up sweeps for cables and antennas by 30%. The ODTF-1 optical DTF module gives the analyzers the ability to be a portable fiber tester in remote radio head applications, shows fiber measurements the same way as traditional RF tests, and provides 10 cm event resolution.
