

# Zigbee Module Adds Wireless Networking Capability

The Telegesis ETRX2 module is a low-power, 2.4 GHz ISM band transceiver that is based on the Ember EM250 single-chip ZigBee/IEEE802.15.4 solution. It can be integrated into any device without the need for RF experience and expertise. Using EmberZNet2.2 meshing technology, the module enables the engineer to add wireless networking capability to products. The module's AT-style command line interface allows the integration of meshing radio technology without complex software engineering.
