

Network Simulator Makes LTE Device Testing Easy

Anite announces the recent launch of 'SAS LTE'. 'SAS LTE' is an easy-to-use network simulator solution that helps mobile device manufacturers and network operators identify and eliminate LTE interoperability issues quickly and cost-effectively. 'SAS LTE' expands the technology support of Anite's 3GPP (GERAN/UTRAN) IOT (interoperability testing) solution, 'SAS'. 'SAS LTE' enables comprehensive testing of LTE devices in a similar, controllable and repeatable manner, accelerating time-to-market and ensuring that new devices meet customer expectations. Interoperability testing is essential in verifying that new handsets and data cards deliver the anticipated mobile user experience. 'SAS' is a solution that ensures new product introduction costs and subscriber churn are substantially reduced by improving device validation times and minimizing device defects.
